Jun 7, 2019 Introduction Traumatic injuries are seen in nearly one-third of pediatric accidents and are present in approximately one-fourth of pediatric paraplegics. Of these children, more than 50 per cent present with severe underlying injuries. According to the World Health Organization (WHO), more than 10 million disability adjusted life years are lost every year due to injuries in children. Also, more than 95,000 children die every year due to road traffic accidents. In India, about 1,2000 children, aged 0 to 14 years, die in road traffic accidents. Traumatic injuries account for 21 per cent of pediatric admissions in the pediatric intensive care unit (PICU), and orthopaedic trauma injuries account for 26 per cent of all trauma admissions to the PICU.

Traumatic brain injury (TBI) is associated with a mortality rate of 30–50 per cent, and the overall mortality rate from all injuries is 5–10 per cent in children. According to a report of World Report on Road Traffic Injury (W.H.O., 2016), childhood road traffic injuries are more lethal than armed conflict injuries. Out of nearly 3600 road traffic deaths, more than 90 per cent occurred in the paediatric age group. According to an estimation, nearly 36 per cent of accidental deaths in children between 12 to 14 years of age could be attributed to road traffic injuries. During 2000–2001, there were 3080 deaths among 12 to 14 years due to road accidents, accounting for a fatality rate of 24 per 100,000. Of the deaths in the paediatric age group, 79 per cent were in children between 10 and 14 years of age. TBI is the most disabling and costly paediatric injury. A recent report on the epidemiology of childhood brain injury in a developing country showed that only 4.4 per cent of all paediatric deaths and 16.1 per cent of all paediatric disability-adjusted life years (DALYs) are due to TBI. According to an estimate of the Inter-Agency Task Force (IATF), motor vehicle crashes are the single leading cause of injury in children. Out of all road traffic accidents in children, approximately 80 per cent involve motor vehicles. More than 30 per cent of road traffic injuries occur in the age group of 0–14 years, and more than 70 per cent of non-fatal crashes that result in hospitalisation of injured children occur between the ages of 4 and 14 years. The youngest and oldest children are f678ea9f9e
